

TRIOS CYBER

LABORATORY PRACTICE 22

Wazuh Dashboard Investigation

Name: Matthew Josue Portilla Morejon

1. Laboratory Objective and Investigation Scope

The Day 22 activity used the Wazuh Dashboard Threat Hunting interface to investigate events from one specific endpoint. The workflow progressively narrowed the event set by agent, time range, rule level, and a specific Windows event, preserving the search steps used to reach the final result.

Element	Observed value	Purpose / result
Agent	Windows-Agent (ID 002)	Specific monitored endpoint
Endpoint IP	10.10.20.30	Source address shown by Wazuh
Dashboard area	Threat Hunting - Events	Search and filtering workspace

2. Wazuh Server and Windows Agent Readiness

Before the investigation, the Wazuh server components and the Windows agent service were verified. The Wazuh indexer, manager, Filebeat, and dashboard returned active, while the Windows WazuhSvc service was reported as Running.

```
matthew@trioscyber:~$ sudo systemctl restart wazuh-manager
matthew@trioscyber:~$ systemctl is-active wazuh-indexer
systemctl is-active wazuh-manager
systemctl is-active filebeat
systemctl is-active wazuh-dashboard
active
active
active
active
```

```
matthew@DESKTOP-V0JCDSO C:\Users\matthew>powershell.exe -NoProfile -Command "Restart-Service WazuhSvc;
Start-Sleep -Seconds 3; Get-Service WazuhSvc"

Status  Name      DisplayName
-----
Running WazuhSvc  Wazuh
```

3. Agent and Time-Range Filtering

Threat Hunting was filtered to the specific agent Windows-Agent and a defined recent time range. This reduced the initial event set to records generated by the selected endpoint and established the time boundary for the investigation.

4. Rule-Level Filtering

The search was narrowed further by rule level. Applying the rule-level condition reduced the event list to alerts matching the selected severity, demonstrating how Wazuh can focus an investigation on higher-priority or otherwise relevant detections.

5. Specific Event and Time Narrowing

The investigation was then reduced to a specific Windows event within a more precise time interval. Event ID 7045 isolated the Windows service-creation activity and produced the final target record for detailed inspection.

6. Investigation Filter Sequence

Step	Filter / action	Purpose
1	Select Windows-Agent	Restrict results to one endpoint
2	Apply time range	Limit the investigation period
3	Filter by rule level	Reduce results by alert severity
4	Filter Event ID 7045	Isolate Windows service creation
5	Open Document Details	Verify agent, rule, and event fields

7. Conclusions

The Wazuh Dashboard investigation successfully narrowed endpoint telemetry from a broad event set to one specific Windows service-creation event. The final result was associated with Windows-Agent (ID 002) at 10.10.20.30 and demonstrated the use of time, rule-level, and event filters to support focused SOC investigation.

8. Event Details and Source Endpoint Verification

The selected result was opened in Document Details to validate the source endpoint and the event context. Wazuh identified agent ID 002 as Windows-Agent at 10.10.20.30. The event data showed Service Control Manager Event ID 7045 for service TriosLab21, while the rule section classified the record as New Windows Service Created under rule ID 61138, rule level 5, with MITRE technique T1543.003 (Windows Service).
