

TRIOS CYBER

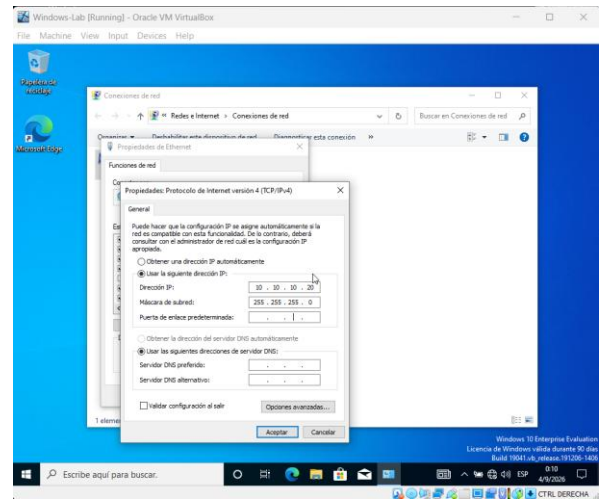

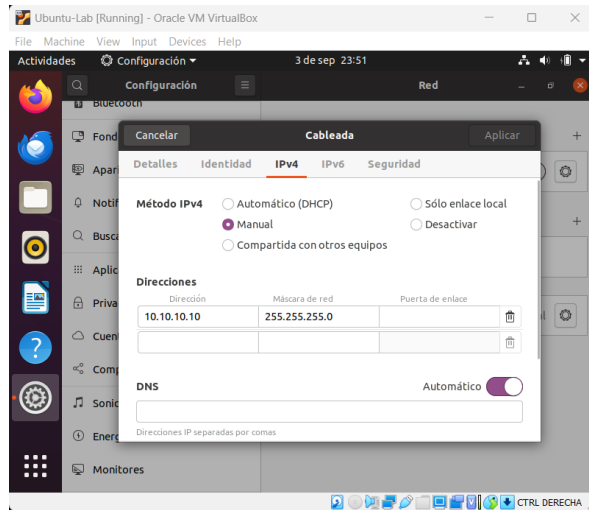

LABORATORY PRACTICE 1

Isolated Virtual Network Laboratory

Name: Matthew Josue Portilla Morejon

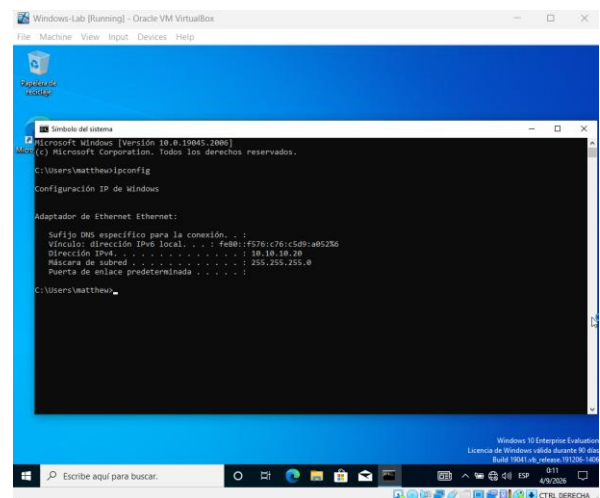

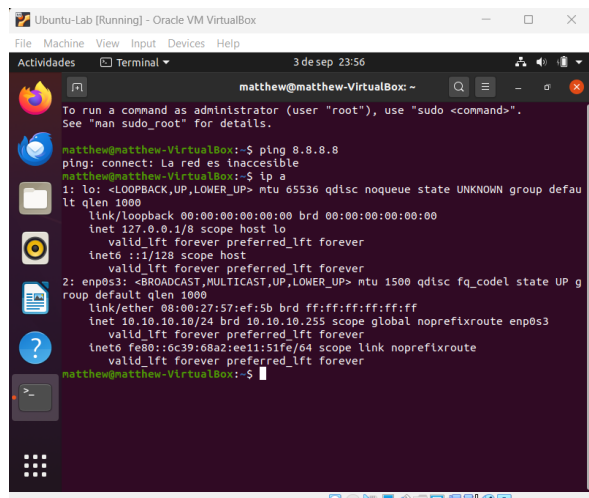

3. Static IP Configuration

Static IPv4 addresses were assigned within the same subnet. Ubuntu was configured with 10.10.10.10/24 and Windows was configured with 10.10.10.20/24. No default gateway was configured so the laboratory remained isolated.

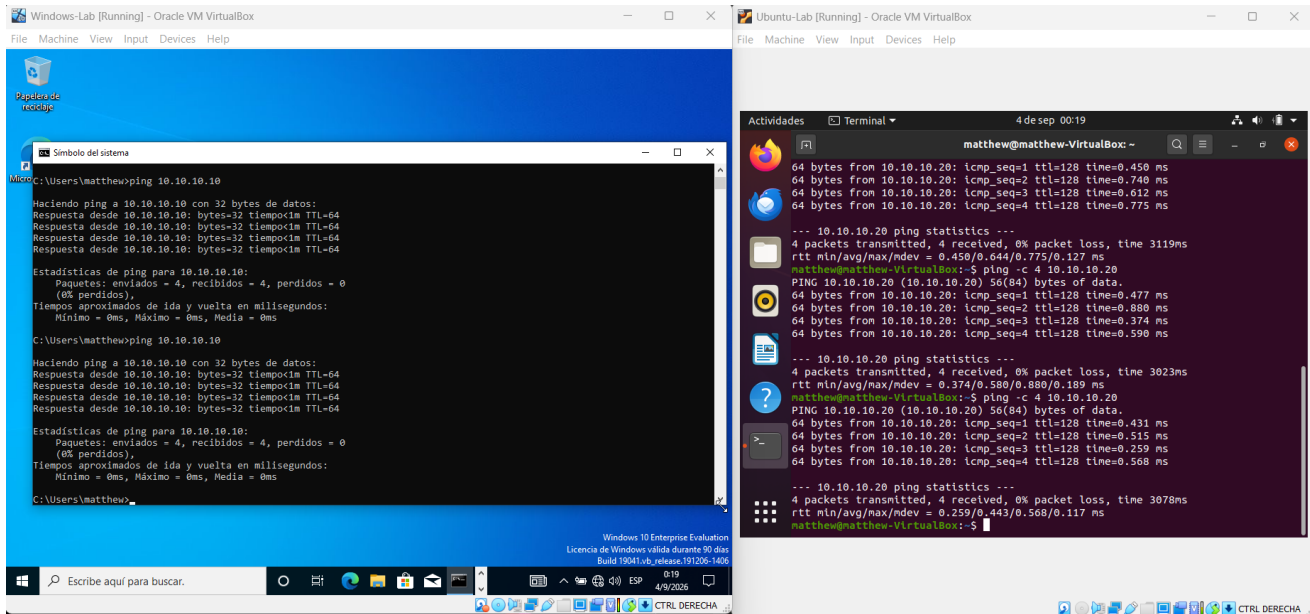

4. IP Address Verification

The assigned addresses were verified from each operating system. The ip a command was used in Ubuntu, and ipconfig was used in Windows to confirm the active IPv4 configuration.

5. Connectivity Test and Final Topology

Connectivity between the two virtual machines was tested with the ping command. Successful ICMP replies with 0% packet loss confirmed bidirectional communication between Windows and Ubuntu through LAB-NET.

6. Isolation Verification

External connectivity was tested using the public address 8.8.8.8. The requests failed from the virtual environment, confirming that the internal laboratory network did not provide Internet access.
